Q.1. Explain Carnot cycle in details?
 According to first law of thermodynamics it is possible to convert heat into equivalent amount of work. However it is not possible to convert heat into work quantitatively without causing a change in surrounding. Some heat is always used either to increase internal energy or given to surrounding. This has been illustrated by a hypothetical process called as Carnot cycle. It can be used to calculate maximum convertibility of the heat into work. It is also called as Carnot heat engine.
 Carnot heat engine consist of 1mole of ideal gas in a cylinder fitted with weightless & frictionless piston. It is insulated from all sides except from the bottom. There are two heat reservoirs. one at higher temp T_2 & second at lower temp T_1 . The higher temp reservoir is called as source & low temp reservoir is called sink.

c) van Hoff equation $\ln K_p = -\Delta H/RT + c$ give a quantitative expression of the Le Chatelier principle with temperature and equilibrium constant endothermic reaction $\Delta H > 0$ an increase in temperature increases the value of K_p of the reaction.

d) Explain the Physical significance of Gibbs free energy?
 => The Gibbs free energy is one of the most important thermodynamic function for the characterization of a system it is a factor in determining outcomes such as a voltage of electrochemical cell and the equilibrium constant for a reversible reaction. Gibbs free energy tell us about feasibility of reaction it means that it tells whether the reaction takes place or not the reaction and extent reaction.

Q.3. Discuss phase diagram of lead-silver system and illustrate the principle of Pattinson's process for enrichment of silver.

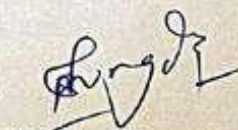

Q.4. Describe sulphur system with the help of phase diagram.

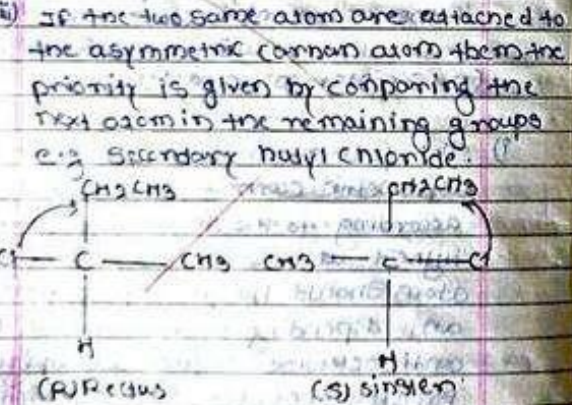

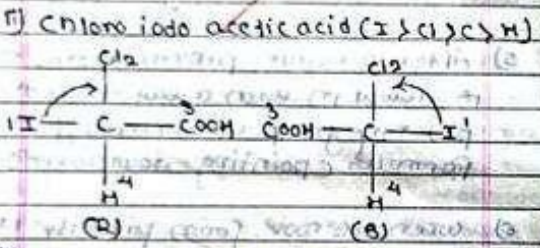

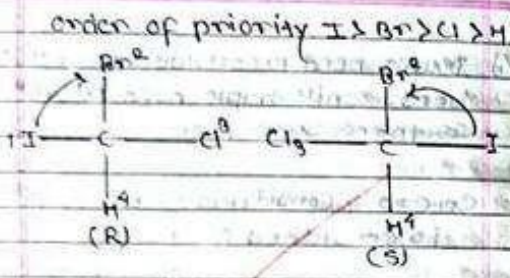

Q.5. Discuss nuclear shell model and give its advantages.

Q.6. What is dipole moment? How is it used to calculate percentage ionic character of a polar covalent bond? Calculate the percentage ionic character of Li-H bond if its observed dipole moment is $1.963 \times 10^{-29} \text{ cm}$ and bond length is 1.595 \AA . (Given $= 1.6 \times 10^{-19} \text{ C}$)

Q.7. What is first order of reaction? Derive the equation of rate constant for first order reaction.

v) When the double bonded or triple bond groups are present around the asymmetric carbon atom then they are considered as the atom and three atom respectively.

e.g. In glyceraldehyde

Note that in all cases the molecule is rotated in such a way that the lowest priority group is at the bottom.
